Moments and non-vanishing of L-functions

Joint work with Alexandra Florea (Columbia) and Matilde Lalin (Montréal)

Chantal David, Concordia University, Montréal

Upstate New York Online Number Theory Colloquium October 2020

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

Let

$$\zeta(s) = \sum_{n=1}^{\infty} \frac{1}{n^s} = \prod_{p \text{ prime}} \left(1 - \frac{1}{p^s}\right)^{-1}, \qquad \Re(s) > 1.$$

It was shown by Riemann that $\zeta(s)$ satisfies the functional equation

$$\Lambda(s) = \Lambda(1-s),$$
 where $\Lambda(s) = \pi^{-s/2} \Gamma(s/2) \zeta(s),$

and then has meromorphic continuation to the complex plane, with a simple pole at s = 1.

▲□▶▲□▶▲≡▶▲≡▶ ≡ めぬる

Some of the deepest questions of analytic number theory are concerned with the size and the zeroes of $\zeta(s)$ inside the critical strip $0 < \Re(s) < 1$.

Riemann Hypothesis:

If $\zeta(s) = 0$ and $0 < \Re(s) < 1$, then $\Re(s) = \frac{1}{2}$.

Some of the deepest questions of analytic number theory are concerned with the size and the zeroes of $\zeta(s)$ inside the critical strip $0 < \Re(s) < 1$.

Riemann Hypothesis: If $\zeta(s) = 0$ and $0 < \Re(s) < 1$, then $\Re(s) = \frac{1}{2}$.

Moments of $\zeta(\frac{1}{2} + it)$: There exists g_k such that

$$\lim_{T\to\infty}\frac{1}{(\log T)^{k^2}}\frac{1}{T}\int_0^T \left|\zeta\left(\frac{1}{2}+it\right)\right|^{2k} dt = a_k g_k$$

What is the combinatorial constant g_k ?

- k = 3 Conrey and Ghosh (1992) conjectured that $g_3 = \frac{42}{9!}$
- k = 4 Conrey and Gonek (1998) conjectured that $g_4 = \frac{24024}{16!}$

Random Matrix Model: Following the work of Montgomery (1973), and then Katz and Sarnak (1999), we believe that statistics on the zeroes of *L*-functions match the statistics on the eigenvalues of random matrices in certain symmetry groups associated to the family.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

Let $Z(U, \theta) = \det(I - Ue^{-i\theta})$ be the characteristic polynomial of a of $N \times N$ unitary matrix $U \in U(N)$. The set U(N) is a probability space with respect to the Haar measure.

Let $Z(U, \theta) = \det(I - Ue^{-i\theta})$ be the characteristic polynomial of a of $N \times N$ unitary matrix $U \in U(N)$. The set U(N) is a probability space with respect to the Haar measure.

Keating and Snaith (2000) showed

$$\lim_{N\to\infty}\frac{1}{N^{k^2}}\int_{U(N)}|Z(U,\theta)|^{2k} \, dU=g_k, \quad g_k=\prod_{j=0}^{k-1}\frac{j!}{(j+k)!}.$$

Let $Z(U, \theta) = \det(I - Ue^{-i\theta})$ be the characteristic polynomial of a of $N \times N$ unitary matrix $U \in U(N)$. The set U(N) is a probability space with respect to the Haar measure.

Keating and Snaith (2000) showed

$$\lim_{N\to\infty}\frac{1}{N^{k^2}}\int_{U(N)}|Z(U,\theta)|^{2k}\ dU=g_k,\ g_k=\prod_{j=0}^{k-1}\frac{j!}{(j+k)!}.$$

We have

$$g_1 = 1, \ g_2 = \frac{1}{12}, \ g_3 = \frac{42}{9!}, \ g_4 = \frac{24024}{16!}$$

Let $Z(U, \theta) = \det(I - Ue^{-i\theta})$ be the characteristic polynomial of a of $N \times N$ unitary matrix $U \in U(N)$. The set U(N) is a probability space with respect to the Haar measure.

Keating and Snaith (2000) showed

$$\lim_{N\to\infty}\frac{1}{N^{k^2}}\int_{U(N)}|Z(U,\theta)|^{2k}\ dU=g_k,\ g_k=\prod_{j=0}^{k-1}\frac{j!}{(j+k)!}.$$

Keating and Snaith Conjecture:

$$\int_{-T}^{T} \left| \zeta \left(\frac{1}{2} + it \right) \right|^{2k} dt \sim a_k g_k T (\log T)^{k^2}, \quad g_k = \prod_{j=0}^{k-1} \frac{j!}{(j+k)!}.$$

Families of L-functions

From the work of Katz and Sarnak, we are lead to believe that statistics for families of L-functions are similar to statistics for $\zeta(\frac{1}{2} + it)$, $t \in [0, T]$, and are also modelled by random matrix theory. Each family has a symmetry type (unitary, symplectic or orthogonal) which governs the statistics.

Each family has a symmetry type (unitary, symplectic or orthogonal) which governs the statistics.

Let χ be a Dirichlet character of modulus ${\it q},$ i.e. a multiplicative function

$$\chi: (\mathbb{Z}/q\mathbb{Z})^* \to \mathbb{C}^*,$$

extended to the integers by periodicity and by setting $\chi(a) = 0$ if $(a, q) \neq 1$. The Dirichlet L-function associated to χ is

$$L(s,\chi) = \sum_{n=1}^{\infty} \frac{\chi(n)}{n^s} = \prod_{p \text{ prime}} \left(1 - \frac{\chi(p)}{p^s}\right)^{-1} \qquad \Re(s) > 1.$$

Functional equation for Dirichlet L-functions

If χ is a primitive character of conductor q (and χ is even), then

$$\Lambda(s,\chi) = \frac{\tau(\chi)}{q^{1/2}} \Lambda(1-s,\overline{\chi}), \quad \Lambda(s,\chi) = \left(\frac{\pi}{q}\right)^{-s/2} \Gamma(s/2) L(s,\chi)$$

where the sign of the functional equation involves the Gauss sum

$$\tau(\chi) = \sum_{m=1}^{q} \chi(m) e^{2\pi i m/q}$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

Functional equation for Dirichlet L-functions

Quadratic Dirichlet L-functions

For quadratic characters $\chi^2 = \chi_0$, it was showed by Gauss that for $\chi(\cdot) = \left(\frac{\cdot}{q}\right)$, q prime, we have

$$au(\chi) = egin{cases} q^{1/2} & q \equiv 1 \ \mathrm{mod} \ 4 \ iq^{1/2} & q \equiv 3 \ \mathrm{mod} \ 4, \end{cases}$$

and for any primitive quadratic character of conductor q

$$\Lambda(s,\chi) = \Lambda(1-s,\chi), \quad \Lambda(s,\chi) = \left(\frac{\pi}{q}\right)^{-s/2} \Gamma(s/2) L(s,\chi).$$

• Since $\overline{\chi} = \chi$ for quadratic characters, there would be forced vanishing at $s = \frac{1}{2}$ if the sign of the functional equation $\neq 1$.

Quadratic Dirichlet L-functions

For quadratic characters $\chi^2 = \chi_0$, it was showed by Gauss that for $\chi(\cdot) = \left(\frac{\cdot}{q}\right)$, q prime, we have

$$au(\chi) = egin{cases} q^{1/2} & q \equiv 1 \mod 4 \ iq^{1/2} & q \equiv 3 \mod 4, \end{cases}$$

and for any primitive quadratic character of conductor q

• Since $\overline{\chi} = \chi$ for quadratic characters, there would be forced vanishing at $s = \frac{1}{2}$ if the sign of the functional equation $\neq 1$.

• If $L(\frac{1}{2},\chi) = 0$ for a quadratic character, then the zero has order at least 2.

Moments of quadratic Dirichlet L-functions

Using Random Matrix Theory, Keating and Snaith (2000) conjectured that

$$\sum_{\substack{\chi^2 = \chi_0 \\ \operatorname{cond}(\chi) \leq X}}^* L(\frac{1}{2}, \chi)^k \sim a'_k g'_k X \left(\log X\right)^{\frac{k(k+1)}{2}}$$

with an explicit formula for the combinatorial constant g'_k coming from the random matrix model.

Moments of quadratic Dirichlet L-functions

Using Random Matrix Theory, Keating and Snaith (2000) conjectured that

$$\sum_{\substack{\chi^2 = \chi_0 \\ \operatorname{cond}(\chi) \leq X}}^* L(\frac{1}{2}, \chi)^k \sim a'_k g'_k X \left(\log X\right)^{\frac{k(k+1)}{2}}$$

with an explicit formula for the combinatorial constant g'_k coming from the random matrix model.

Comparing with the moments of $\zeta(\frac{1}{2} + it)$,

$$\int_{-T}^{T} \left| \zeta \left(\frac{1}{2} + it \right) \right|^{2k} dt \sim a_k g_k T \left(\log T \right)^{k^2}$$

we notice that the formula are different (symplectic versus unitary).

It is conjectured by Chowla that $L(\frac{1}{2}, \chi) \neq 0$ for all L-functions $L(s, \chi)$ attached to primitive Dirichlet characters.

Non-vanishing of Dirichlet L-functions

It is conjectured by Chowla that $L(\frac{1}{2}, \chi) \neq 0$ for all L-functions $L(s, \chi)$ attached to primitive Dirichlet characters.

The conjectures of Katz and Sarnak on the one-level density in families of L-functions imply that $L(\frac{1}{2}, \chi) \neq 0$ for all L-functions in a family \mathscr{F} except a set of density 0. The conjectures of Katz and Sarnak cover number fields and function fields. Over function fields, we will see that Chowla's conjecture is not true (Li, 2018).

Non-vanishing of Dirichlet L-functions

It is conjectured by Chowla that $L(\frac{1}{2}, \chi) \neq 0$ for all L-functions $L(s, \chi)$ attached to primitive Dirichlet characters.

The conjectures of Katz and Sarnak on the one-level density in families of L-functions imply that $L(\frac{1}{2}, \chi) \neq 0$ for all L-functions in a family \mathscr{F} except a set of density 0. The conjectures of Katz and Sarnak cover number fields and function fields. Over function fields, we will see that Chowla's conjecture is not true (Li, 2018).

For a given family \mathcal{F} , can we prove:

- Infinitely many $\chi \in \mathscr{F}$ such that $L(\frac{1}{2}, \chi) \neq 0$?
- A positive density of $\chi \in \mathscr{F}$ such that $L(\frac{1}{2}, \chi) \neq 0$?
- $L(\frac{1}{2}, \chi) \neq 0$ for all $\chi \in \mathscr{F}$ except a set of density 0?

• $L(\frac{1}{2},\chi) \neq 0$ for all $\chi \in \mathscr{F}$?

By Cauchy–Schwarz,

$$\sum_{\substack{\chi^2 = \chi_0 \\ \operatorname{cond}(\chi) \le X}}^* L(\frac{1}{2}, \chi) \le \left(\sum_{\substack{\chi^2 = \chi_0 \\ \operatorname{cond}(\chi) \le X}}^* L(\frac{1}{2}, \chi)^2\right)^{1/2} \left(\sum_{\substack{\chi^2 = \chi_0 \\ \operatorname{cond}(\chi) \le X}}^* 1\right)^{1/2}$$

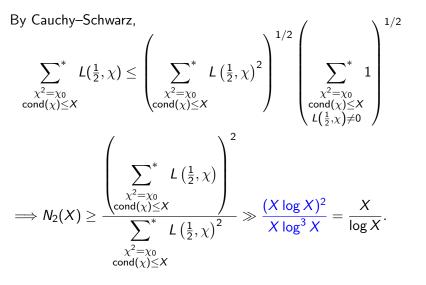

▲□▶ ▲圖▶ ▲臣▶ ▲臣▶ 三臣 - のへ⊙

By Cauchy–Schwarz,

$$\sum_{\substack{\chi^2 = \chi_0 \\ \operatorname{cond}(\chi) \le X}}^* L(\frac{1}{2}, \chi) \le \left(\sum_{\substack{\chi^2 = \chi_0 \\ \operatorname{cond}(\chi) \le X}}^* L(\frac{1}{2}, \chi)^2\right)^{1/2} \left(\sum_{\substack{\chi^2 = \chi_0 \\ \operatorname{cond}(\chi) \le X}}^* 1\right)^{1/2}$$

$$\Longrightarrow N_2(X) \ge \frac{\left(\sum_{\substack{\chi^2 = \chi_0 \\ \operatorname{cond}(\chi) \le X}}^* L(\frac{1}{2}, \chi)\right)^2}{\sum_{\substack{\chi^2 = \chi_0 \\ \operatorname{cond}(\chi) \le X}}^* L(\frac{1}{2}, \chi)^2}$$

(ロ)、(型)、(E)、(E)、 E) の(()

using the first 2 moments.

◆□▶ ◆□▶ ◆三▶ ◆三▶ ○○○

Using the first 2 moments (an upper bound is sufficient for the second moment), we get that

$$N_2(X) := \sum_{\substack{\chi^2 = \chi_0 \\ \operatorname{cond}(\chi) \le X \\ L(\frac{1}{2}, \chi) \neq 0}}^* 1 \gg \frac{X}{\log X}, \quad \text{where} \sum_{\substack{\chi^2 = \chi_0 \\ \operatorname{cond}(\chi) \le X}}^* 1 \sim c_2 X$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

which is infinitely many, but not a positive density. The moments grow too fast to get a positive density.

Using the first 2 moments (an upper bound is sufficient for the second moment), we get that

$$N_2(X) := \sum_{\substack{\chi^2 = \chi_0 \\ \operatorname{cond}(\chi) \leq X \\ L(\frac{1}{2}, \chi) \neq 0}}^* 1 \gg \frac{X}{\log X}, \quad \text{where} \sum_{\substack{\chi^2 = \chi_0 \\ \operatorname{cond}(\chi) \leq X}}^* 1 \sim c_2 X$$

which is infinitely many, but not a positive density. The moments grow too fast to get a positive density.

We need to use a mollifier to control the growth of the moments. The idea of a mollifier goes back to Bohr and Landau (1914) to study the zeroes of $\zeta(s)$. Selberg (1946) used it to show that a positive proportion of the non-trivial zeroes of $\zeta(s)$ satisfy RH.

Mollified moments and non-vanishing

For the moments, we want a mollifier $M(\chi) \approx L(\frac{1}{2}, \chi)^{-1}$ such that

$$\sum_{\substack{\chi^2 = \chi_0 \\ \operatorname{cond}(\chi) \leq X}}^* L(\frac{1}{2}, \chi)^k M(\chi)^k \sim c_k X,$$

compared to the non-mollified moments

$$\sum_{\substack{\chi^2 = \chi_0 \\ \operatorname{cond}(\chi) \leq X}}^* L(\frac{1}{2}, \chi)^k \sim a'_k g'_k X \left(\log X\right)^{\frac{k(k+1)}{2}}$$

Mollified moments and non-vanishing

For the moments, we want a mollifier $M(\chi) \approx L(\frac{1}{2}, \chi)^{-1}$ such that

$$\sum_{\substack{\chi^2 = \chi_0 \\ \operatorname{cond}(\chi) \leq X}}^* L(\frac{1}{2}, \chi)^k M(\chi)^k \sim c_k X,$$

compared to the non-mollified moments

С

$$\sum_{\substack{\chi^2 = \chi_0 \\ \operatorname{ond}(\chi) \leq X}}^{*} L(\frac{1}{2}, \chi)^k \sim a'_k g'_k X \left(\log X\right)^{\frac{k(k+1)}{2}}$$

Soundararajan (2000) computed the first two mollified moments and showed that $L(\frac{1}{2}, \chi) \neq 0$ for at least 87.5% of quadratic χ .

Mollified moments and non-vanishing

For the moments, we want a mollifier $M(\chi) \approx L(\frac{1}{2}, \chi)^{-1}$ such that

$$\sum_{\substack{\chi^2 = \chi_0 \\ \operatorname{cond}(\chi) \leq X}}^* L(\frac{1}{2}, \chi)^k M(\chi)^k \sim c_k X,$$

compared to the non-mollified moments

С

$$\sum_{\substack{\chi^2 = \chi_0 \\ \operatorname{ond}(\chi) \leq X}}^{*} L(\frac{1}{2}, \chi)^k \sim a'_k g'_k X \left(\log X\right)^{\frac{k(k+1)}{2}}$$

Soundararajan (2000) computed the first two mollified moments and showed that $L(\frac{1}{2}, \chi) \neq 0$ for at least 87.5% of quadratic χ .

Under GRH, Ozluk and Snyder (1999) showed that $L(\frac{1}{2}, \chi) \neq 0$ for at least 93.75% of quadratic χ , using the one-level density.

Cubic Dirichlet characters

Let χ be a cubic character of modulus p

$$\chi: (\mathbb{Z}/p\mathbb{Z})^* \to \{1, \omega, \omega^2\} \subseteq \mathbb{C}^*, \quad \omega = e^{2\pi i/3},$$

with $p \equiv 1 \mod 3$.

Cubic Dirichlet characters

Let χ be a cubic character of modulus p

$$\chi: (\mathbb{Z}/p\mathbb{Z})^* \to \{1, \omega, \omega^2\} \subseteq \mathbb{C}^*, \quad \omega = e^{2\pi i/3},$$

with $p \equiv 1 \mod 3$.

For each prime $p \equiv 1 \mod 3$, we have the two cubic residue symbols

$$\chi_p(a) \equiv a^{(p-1)/3} \mod p$$
, and the conjugate $\overline{\chi}_p$,

which extend by multiplicativity to all (primitive) cubic characters.

(日)((1))

Li (2018): vanishing for ≫ (q^d)^{1/3}-ε of the quadratic characters with conductor of degree d.

Cubic characters over $\mathbb{F}_q[\mathcal{T}]$

- Kummer case q ≡ 1 mod 3: There are 2 cubic characters of conductor P for every prime P ∈ F_q[T].
- Non-Kummer case q ≡ 2 mod 3: There are 2 characters of conductor P for every prime P of even degree P ∈ F_q[T].

Then,

$$\sum_{\substack{\chi^3 = \chi_0 \\ \deg \operatorname{cond}(\chi) = d}}^* 1 \sim \begin{cases} C_1 q^d & q \equiv 2 \operatorname{mod} 3 \\ C_2 dq^d & q \equiv 1 \operatorname{mod} 3 \end{cases}$$

First moments of cubic L-functions over function fields

Theorem (D., Florea, Lalin (2019))

Let q be an odd prime power such that $q \equiv 2 \pmod{3}$. Then

$$\sum_{\substack{\chi^3 = \chi_0 \\ \deg \operatorname{cond}(\chi) = d}}^{*} L(\frac{1}{2}, \chi) = Cq^d + O\left(q^{d\left(\frac{7}{8} + \varepsilon\right)}\right).$$

Theorem (D., Florea, Lalin (2019)) Let q be an odd prime power such that $q \equiv 1 \pmod{3}$. Then,

$$\sum_{\substack{\chi^3 = \chi_0 \\ \deg \operatorname{cond}(\chi) = d}}^{*} L(\frac{1}{2}, \chi) = C_1 dq^d + C_2 q^d + O\left(q^{d(\frac{1+\sqrt{7}}{4} + \varepsilon)}\right).$$

Nonvanishing for cubic *L*-functions - Non Kummer case

- Bounding the second moment and using Cauchy-Schwartz (DFL, 2019): nonvanishing for $\gg (q^d)^{1-\varepsilon}$.
- Ellenberg-Li-Shusterman (2020) using algebraic geometry methods to prove nonvanishing for $\gg q^d/d^{1/2}$.
- The one-level density does not give a positive proportion of non-vanishing in this case.

Nonvanishing for cubic *L*-functions - Non Kummer case

- Bounding the second moment and using Cauchy-Schwartz (DFL, 2019): nonvanishing for $\gg (q^d)^{1-\varepsilon}$.
- Ellenberg-Li-Shusterman (2020) using algebraic geometry methods to prove nonvanishing for $\gg q^d/d^{1/2}$.
- The one-level density does not give a positive proportion of non-vanishing in this case.

Theorem (D., Florea, Lalin (2020))

Let q be an odd prime power such that $q \equiv 2 \pmod{3}$.

$$\#\left\{\chi^3=\chi_0, \ \deg \operatorname{cond}(\chi)=d, \ L\left(\tfrac{1}{2},\chi\right)\neq 0\right\}^* \geq cq^d,$$

where c > 0 is an explicit constant.

This is the first result about a positive proportion for a cubic family. It uses mollified moments.

The results would be the same over number fields, under GRH.

Sac

Parenthesis: Nonvanishing for cubic (Kummer)

In the Kummer case, it is possible to find a a positive proportion of non-vanishing inside inside the thin subfamily, using the one-level density. This was done over number fields and then under GRH.

Theorem (D., Güloğlu (2020))

Assume GRH. Then

$$\#\left\{\chi=\left(\frac{\cdot}{c}\right)_{3}, c\in\mathbb{Q}[\omega], c \; SF, N(c)\leq X, L\left(\frac{1}{2}, \chi\right)\neq 0\right\}\geq \frac{2}{13}X.$$

This is a positive proportion in the thin subfamily of cubic residue symbols $(\frac{i}{c})_3$, where $c \in \mathbb{Z}[\omega]$ is square-free.

Technique of mollified moments (non-Kummer)

• We compute the first mollified moment, following the techniques of DFL for the first moment:

$$\sum_{\substack{\chi^3 = \chi_0 \\ \deg \operatorname{cond}(\chi) = d}}^* L(\frac{1}{2}, \chi) M(\chi) \sim B_1 q^d,$$

Technique of mollified moments (non-Kummer)

• We compute the first mollified moment, following the techniques of DFL for the first moment:

$$\sum_{\substack{\chi^3=\chi_0\\ \deg \operatorname{cond}(\chi)=d}}^* L(\tfrac{1}{2},\chi) M(\chi) \sim B_1 q^d,$$

• We compute a sharp upper bound for the second mollified moment, using the recent techniques of Soundararajan (2000), Harper (2013) and Lester-Radziwill (2019):

$$\sum_{\substack{\chi^3=\chi_0\\ \deg \operatorname{cond}(\chi)=d}}^* |L(\frac{1}{2},\chi)M(\chi)|^2 \leq B_2 q^d.$$

Technique of mollified moments (non-Kummer)

• We compute the first mollified moment, following the techniques of DFL for the first moment:

$$\sum_{\substack{\chi^3=\chi_0\\ \deg \operatorname{cond}(\chi)=d}}^* L(\tfrac{1}{2},\chi) M(\chi) \sim B_1 q^d,$$

• We compute a sharp upper bound for the second mollified moment, using the recent techniques of Soundararajan (2000), Harper (2013) and Lester-Radziwill (2019):

$$\sum_{\substack{\chi^3=\chi_0\\ \text{eg cond}(\chi)=d}}^* |L(\frac{1}{2},\chi)M(\chi)|^2 \leq B_2 q^d.$$

(日) (同) (三) (三)

Then, by Cauchy-Schwarz,

d

$$\# \left\{ \chi^3 = \chi_0, \ \deg \operatorname{cond}(\chi) = d, \ L\left(\frac{1}{2}, \chi\right) \neq 0 \right\}^* \ge \frac{B_1^2}{B_2} q^a$$

The first mollified moment

$$M(\chi) \approx \sum_{\deg h \leq N} \frac{\mu(h)w(h;N)\chi(h)}{|h|^{1/2}} \text{ behaves "like } L(\frac{1}{2},\chi)^{-1}.$$

Reversing the sums, we first evaluate

$$\sum_{\substack{\chi^3 = \chi_0 \\ \deg \operatorname{cond}(\chi) = d}}^{*} L(\frac{1}{2}, \chi) \chi(h).$$

◆□▶ ◆□▶ ◆ 臣▶ ◆ 臣▶ ○ 臣 ○ の Q @

The first mollified moment

$$M(\chi) \approx \sum_{\deg h \leq N} \frac{\mu(h)w(h;N)\chi(h)}{|h|^{1/2}} \text{ behaves "like } L(\frac{1}{2},\chi)^{-1}.$$

Reversing the sums, we first evaluate

- Approximate functional equation for L(¹/₂, χ) gives a principal sum and a dual sum.
- The main term comes from the cubes in the principal sum.
- The non-cubes from the principal sum can be bounded by Lindelöf.
- The dual sum contains Gauss sums, and averages of cubic Gauss sums can be evaluated/bounded from the deep work of Kubota and Patterson.

Bounding the mollified second moment

We need to show that

$$\sum_{\substack{\chi^3 = \chi_0 \\ \deg \operatorname{cond}(\chi) = d}}^* |L(\frac{1}{2}, \chi) M(\chi)|^2 \le B_2 q^d,$$

which is a sharp bound for the second mollified moment.

Bounding the mollified second moment

We need to show that

$$\sum_{\substack{\chi^3 = \chi_0 \\ \deg \operatorname{cond}(\chi) = d}}^* |L(\frac{1}{2}, \chi) M(\chi)|^2 \le B_2 q^d,$$

which is a sharp bound for the second mollified moment.

- Soundararajan (2009): almost sharp bounds for all moments of ζ(s), under RH: ≪_k T(log T)^{k²+ε}.
- Harper (2013): sharp bounds for all moments of ζ(s), under RH: ≪_k T(log T)^{k²}.
- Lester & Radziwiłł (2019): sharp bounds for all mollified moments of quadratic twists of modular forms, under GRH.

Bounding $|L(\frac{1}{2},\chi)|$

Under GRH, we can bound $\log |L(\frac{1}{2}, \chi)|$ by an extremely short Dirichlet polynomial. (Soundararajan (2009), adapted by Bui, Florea, Keating, Roditty-Gershon (2019) to function fields):

$$\log |L(\frac{1}{2},\chi)| \leq \sum_{\deg(P) \leq N} \frac{\Re(\chi(P))a(P;N)}{|P|^{\frac{1}{2}}} + \frac{d}{N} + O(1),$$

where $d = \deg \operatorname{cond}(\chi)$.

Bounding $|L(\frac{1}{2},\chi)|$

Under GRH, we can bound log $|L(\frac{1}{2}, \chi)|$ by an extremely short Dirichlet polynomial. (Soundararajan (2009), adapted by Bui, Florea, Keating, Roditty-Gershon (2019) to function fields):

$$\log |L(\frac{1}{2},\chi)| \leq \sum_{\deg(P) \leq N} \frac{\Re(\chi(P))a(P;N)}{|P|^{\frac{1}{2}}} + \frac{d}{N} + O(1),$$

where $d = \deg \operatorname{cond}(\chi)$.

Taking $N \approx \theta d$ for some θ small enough, we have

$$|L(\frac{1}{2},\chi)|^{k} \leq c_{k} \exp\left(\frac{k}{\theta}\right) \exp\left(k \sum_{\deg P \leq \theta d} \frac{\Re(\chi(P))a(P,N)}{|P|^{\frac{1}{2}}}\right)$$

Bounding the exponential

We need to bound

$$\exp\left(k\sum_{\deg P\leq N}\frac{\Re(\chi(P))a(P,N)}{|P|^{\frac{1}{2}}}\right)=\exp\left(k\Re P_N(\chi)\right),$$

where

$$P_N(\chi) = \sum_{\deg P \leq N} rac{\chi(P) \mathfrak{a}(P, N)}{|P|^{rac{1}{2}}}.$$

Lester & Radziwiłł (2019): Use the bound

$$e^t \leq (1+e^{-\ell/2})\sum_{s\leq \ell}rac{t^s}{s!}$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ □臣 ○のへ⊙

for $t \leq \ell/e^2$ and ℓ even.

Bounding the mollified moment with the exponential

Using $N = \theta d$, we get the bound

$$\sum_{\substack{\chi^3 = \chi_0 \\ \deg \operatorname{cond}(\chi) = d}}^{*} (\Re P_N(\chi))^s |M(\chi)|^k \ll q^d d^{O(1)} (C(\log d)^{1/2} \theta)^{1/\theta}.$$

Bounding the mollified moment with the exponential

Using $N = \theta d$, we get the bound

$$\sum_{\substack{\chi^3 = \chi_0 \\ \deg \operatorname{cond}(\chi) = d}}^{*} (\Re P_N(\chi))^s |M(\chi)|^k \ll q^d d^{O(1)} (C(\log d)^{1/2} \theta)^{1/\theta}$$

Taking $N = \frac{d}{\log d}$, we get the bound

$$\ll rac{q^d}{(\log d)^{(\log d)/2}} \ll rac{q^d}{d^{100000000}}$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

But the short approximation is too short.

Bounding the mollified moment with the exponential

Using $N = \theta d$, we get the bound

$$\sum_{\substack{\chi^3 = \chi_0 \\ \deg \operatorname{cond}(\chi) = d}}^{*} (\Re P_N(\chi))^s |M(\chi)|^k \ll q^d d^{O(1)} (C(\log d)^{1/2} \theta)^{1/\theta}$$

Taking $N = \frac{d}{\log d}$, we get the bound

$$\ll rac{q^d}{(\log d)^{(\log d)/2}} \ll rac{q^d}{d^{100000000}}.$$

But the short approximation is too short.

Following Lester & Radziwiłł (2019), we separate $I = (0, \theta d]$ in:

$$I_0 = (0, d\theta_0], \quad I_1 = (d\theta_0, d\theta_1], \quad \dots, \quad I_J = (d\theta_{J-1}, d\theta_J],$$
$$\theta_J = \frac{e^j}{(\log d)^{1000}}, \quad \theta_J = \theta, \quad J \approx \log \log d$$

A positive proportion

Collecting the results from all the intervals, we get a sharp upper bound of the type

$$\sum_{\substack{\chi^3=\chi_0\\ \deg \operatorname{cond}(\chi)=d}}^* |L(\tfrac{1}{2},\chi)M(\chi)|^{2k} \leq e^{e^{O(k)}}q^d.$$

Theorem (D., Florea, Lalin (2020))

Let q be an odd prime power such that $q \equiv 2 \pmod{3}$. Then

$$\frac{\#\left\{\chi^{3}=\chi_{0}, \text{ deg cond}(\chi)=d, \ L(\frac{1}{2},\chi)\neq 0\right\}^{*}}{\#\left\{\chi^{3}=\chi_{0}, \text{ deg cond}(\chi)=d\right\}^{*}} \geq 0.47e^{-e^{182}}$$
