

## Homework

due on Monday, March 14

Read carefully section 6.1 in the book. Solve the following problems.

**Problem 1.** In class we started a discussion about constructing rational numbers. We considered a set  $A = \mathbb{Z} \times (\mathbb{Z} \setminus \{0\})$  and we declared two elements  $(a, b)$  and  $(p, q)$  of  $A$  to be in relation  $R$  if  $aq = pb$ . Prove that  $R$  is an equivalence relation on  $A$ . What elements belong to the equivalence class of  $(0, 1)$ ?

**Problem 2.** Let  $R$  be a relation on a set  $A$ . Recall the following terminology.

$R$  is **reflexive** if  $xRx$  for every  $x \in A$ .

$R$  is **irreflexive** (or **antireflexive**) if  $xRx$  is false for every  $x \in A$ .

$R$  is **symmetric** if, for any  $x, y \in A$ ,  $xRy$  implies  $yRx$ .

$R$  is **antisymmetric** if, for any  $x, y \in A$ ,  $xRy$  and  $yRx$  imply  $x = y$ .

$R$  is **asymmetric** if, for any  $x, y \in A$ ,  $xRy$  implies that  $yRx$  does not hold.

$R$  is **transitive** if, for all  $x, y, z \in A$ ,  $xRy$  and  $yRz$  imply  $xRz$ .

**Remark.** Some use the name *weakly antisymmetric* for what above is called antisymmetric and the name *antisymmetric* for what above is called asymmetric. But the above terminology seems to be used by majority of recent sources.

a) Let  $R$  be the relation  $a|b$  on the set  $\mathbb{N}$  of natural numbers (in other words,  $aRb$  means  $a|b$ ). Which of the above properties hold for  $R$ . Carefully justify your answer for each property.

b) Let  $A$  be the set of all lines in the plane. Let  $R$  be the relation of being parallel (i.e.  $l_1 R l_2$  if the line  $l_1$  is parallel to the line  $l_2$ ). Prove that  $R$  is an equivalence relation.

c) Let  $R_1$  and  $R_2$  be two equivalence relations on a set  $A$  (recall that this means in particular that  $R_1$  and  $R_2$  are subsets of  $A \times A$ ). Prove that  $R_1 \cap R_2$  is also an equivalence relation.
