

## Homework

due on Wednesday, September 25

Read carefully Chapter 1 of Hartshorne's book. Study Books 1,2,3,4 of the "Elements". Solve problems 1.10, 2.12, 2.14, 2.16 in Chapter 1. Work on several other problems in this chapter.

When you do a construction, write carefully all steps of the construction as discussed in the book. Then provide a proof that your construction works. When you claim that some lines intersect, explain why. Include carefully done drawing using a compass and a ruler.

**Problem 1.** Let  $ABC$  be a triangle. Let  $t_A$  and  $t_B$  be perpendicular bisectors of  $BC$  and  $AC$  respectively. Use the 5th postulate and the results of book 1 to show that  $t_A$  and  $t_B$  intersect.

**Problem 2.** Suppose that the lines  $AB$  and  $CD$  intersect at a point  $P$  such that  $PA \cdot PB = PC \cdot PD$  and such that  $A$  is between points  $P$  and  $B$  and  $C$  is between points  $P$  and  $D$ . Prove that points  $A, B, C, D$  are on one circle. You can use results from books 1-4 of the Elements.

**Problem 3.** Let  $ABC$  be an isosceles triangle ( $AB = AC$ ). Suppose that  $M$  is a point on the side  $AB$  such that  $AB \cdot MB = AM^2$ . Suppose also that  $AM = BC$ . Prove that the angle  $\angle ABC$  is twice the angle  $\angle BAC$ .

**Hint.** Consider the circumcircle  $\Omega$  of triangle  $AMC$ . Show that  $BC$  is tangent to  $\Omega$ . Use this to show that  $\angle CMB = \angle CBM$ . In your proof you can use results from books 1-3 of the Elements.
