

Math 330 Section 1 - Fall 2024 - Homework 15

Published: Tuesday, November 13, 2024
Last submission: Monday, December 2, 2024

Running total: 56 points

Status - Reading Assignments:

The reading assignments you were asked to complete before the first one of this HW are:

MF lecture notes:

ch.1; ch.2.1 - 2.6, ch.3; skim ch.4; ch.5 - 14.1

B/G (Beck/Geoghegan) Textbook:

ch.2 - 13.4

B/K lecture notes:

ch.1.1 (Introduction to sets) (optional)

ch.1.2 (Introduction to Functions) but skip ch.1.2.4: Floor and Ceiling Functions (optional)

New reading assignments:

Reading assignment 1 - due Monday, November 18:

- a. Read carefully MF ch.14.2 and 14.3. Understand the 3 equivalent ways to refer to compactness in metric spaces plus #4 in \mathbb{R}^n . Note that the “extract finite open subcovering” property needs extra careful study!

Reading assignment 2 - due: Wednesday, November 20:

- a. Carefully read the remainder of MF ch.14.
- b. Review B/G ch.13. You have encountered the material already in MF ch.7 and ch.10.

Reading assignment 3 - due Friday, November 22:

- a. Carefully read MF ch.15.1 and 15.3.
- b. Review the end of MF ch.11.2.1, starting at Definition 11.10 (Linear dependence and independence). Carefully read MF ch.15.2.

Be sure to read pages 2 - 4!

Supplementary instructions for reading MF ch.12 - 14:

When you read or reread any topics in those chapters then the following is good advice:

- a. MF ch.12.1: Draw as many pictures as possible to get a feeling for the abstract concepts. Use the metric spaces $(\mathbb{R}^2, d|_{\|\cdot\|_2})$ and $(\mathcal{B}(X, \mathbb{R}), d|_{\|\cdot\|_\infty})$ for this. Do these drawings in particular for
 - open sets and neighborhoods (ch.12.1.3)
 - convergence, expressed with nhoods (the end of def.12.10 in ch.12.1.4)
 - metric and topological subspaces (ch.12.1.7): draw an irregular shaped subset $A \subseteq \mathbb{R}^2$ in two pieces $A = A_1 \uplus A_2$ which do not overlap. Draw some points $x_j \in A$ with ε -nhoods (circles with radius ε about x_j) so that some circles are entirely in A , one with $x_j \in A_1$ which reaches into A° but not into A_2 , and one with $x_j \in A_2$ which reaches both into A° and A_1 . What is $N_\varepsilon^A(x_j)$?
 - Contact points, closed sets and closures (ch.12.1.8): Draw subsets $B \subseteq \mathbb{R}^2$ with parts of their boundary (periphery) drawn solid to indicate that points there belong to B and other parts drawn dashed to indicate that those boundary points belong to the complement. What is \bar{B} ?
 Draw points "completely inside" B , others "completely outside" B , and others on the solid and dashed parts of the boundary. Which ones can you approximate from within B by sequences? Which ones can you surround by circles that entirely stay within B , i.e., which ones are interior points of B ? Which ones can you surround by circles that entirely stay outside the closure of B , i.e., which ones are entirely within \bar{B}° ? Use those pictures to visualize the definitions in this chapter and thm 12.6 and thm.12.7.
 - Now repeat that exercise with an additional set A which is meant to be a metric subspace of \mathbb{R}^2 .
- b. MF ch.12.2 (Continuity): Draw as many pictures as possible to get a feeling for continuity, especially if you did not take multivariable calculus and are not used to dealing with continuous/differentiable functions of more than one variable. Here is a picture.

Figure 0.1: ε - δ continuity

Written assignments on page 3

Written assignment 1: Let X be a nonempty set. For each $j \in \mathbb{N}$ let $(x, y) \mapsto d_j(x, y)$ be a metric on X and let $a_j \in [0, \infty[$ such that $\sum_{j=1}^{\infty} a_j < \infty$ and at least one a_j is not zero. Let

$$d(x, y) := \sum_{j=1}^{\infty} a_j d_j(x, y); \quad (x, y \in X).$$

Prove that d defines a metric on X .

Written assignment 2: Prove Proposition 12.15:

Let (X, \mathcal{U}) be a topological space. If $A \subseteq B \subseteq X$, then $A^\circ \subseteq B^\circ$.

Written assignment 3: Let (X, d) be a metric space and $A \subseteq X$, $A \neq \emptyset$. Let

$$\gamma := \gamma(A) := \inf\{d(x, y) : x, y \in A \text{ and } x \neq y\}.$$

(a) Prove that if $\gamma > 0$ and $(x_n)_n$ is Cauchy in A , then $(x_n)_n$ is constant, eventually.

(b) Use (a) to prove that if $\gamma > 0$, then A is complete.

One point each for (a) and (b)!
